

[VOICE INPUT MODULE THAT STORES PERSONAL DATA]

Abstract of Disclosure

A portable voice input module that can store data. The voice input module stores personal data relevant to the user. The voice input module can connect to a computer. The computer runs a language processing program that can translate voice signals spoken by the user into computer commands. The computer accesses the personal data stored in the memory of the voice input module to execute the computer commands. The language processing program can automatically update its files and databases by connecting to a server using the internet. The language processing program can also translate computerized documents, such as e-mail, into voice signals and send the voice signals to the voice input device for playback.
